1. Define cloud computing & Explain any four characteristics that different from computing.
2. Trace Evolution of cloud computing from hardware evolution to internet software Evolution & show changes cloud platforms.
3. Explain role of server virtualization in cloud computing - Different cloud computing & virtualization.
4. Discuss role of data centres in delivering Cloud services.
5. Differentiate Iaas, Paas, Saas & Xaas with Example.

1A) **Cloud computing**:- It is a Technology in which the cloud data services such as server, Routers, platforms over an internet is called Cloud computing.

Four characteristics of computing resources:-

1. **on demand self service**:- Users can access the resources when ever they needed.
2. **Broad network access**:- The data is sent to the cloud servers over a internet.
3. **Resource pooling**:- This shares the resources to the multiple resources of Users.
4. **Rapid Elasticity**:- So, it increases the resources as cloud server increases.

2A) Evolution of cloud computing are done with Evolution into several stages :-

Main frame computing :- This is main computing resources sends to multiple storing devices.

pettonal computing :- Uses Laptops, mobile phones, Tablets to access the cloud platfolms.

Client server computing :- This first takes server details then it gives accss b/w the client & the server.

Virtualization :- The virtualization tulns the multiple virtual machines.

internet & web evolution :- This is a web application of servers which can access data over internet.

3A) Server virtualization :- It proces the physical server into the the multiple virtual servers on software is called server virtualization.

Role of server virtualization :-

* Allows multiple virtual machine to xun on one physical server
* improves hardwale utilization.
* reduces topelating costs.
* isolation b/w virtual machines.
* Enable flexible allocation of cpu, memoly & the storage.

Virtualization	Cloud computing
* Creates virtual versions of cloud servers. * Helps share physical servers. * operates within private. * EX:- VM ware	* Enables cloud servers of data over network. * one demand server. * operates private, public & hybrid. * EX:- AWS.

4) Data centre is a computing resources containing servers as data to store, process & deploy.

* Roles:-

1. Data storage
2. Data processing
3. Networking
4. security
5. Availability.

5) Iaas - It is infrastructure as a service

* provide VM storage

EX:- Amazon EC

Paas:- platform as a service.

* develop, test & deploy the data.

EX:- Google app Engine

Saas:- Software as a service.

* sends data to a multiple virtual servers.

EX:- Google DOCS.

Xaas:- Every things as a service

* It is used for many process.

EX:- Twilieng.
